Platform.

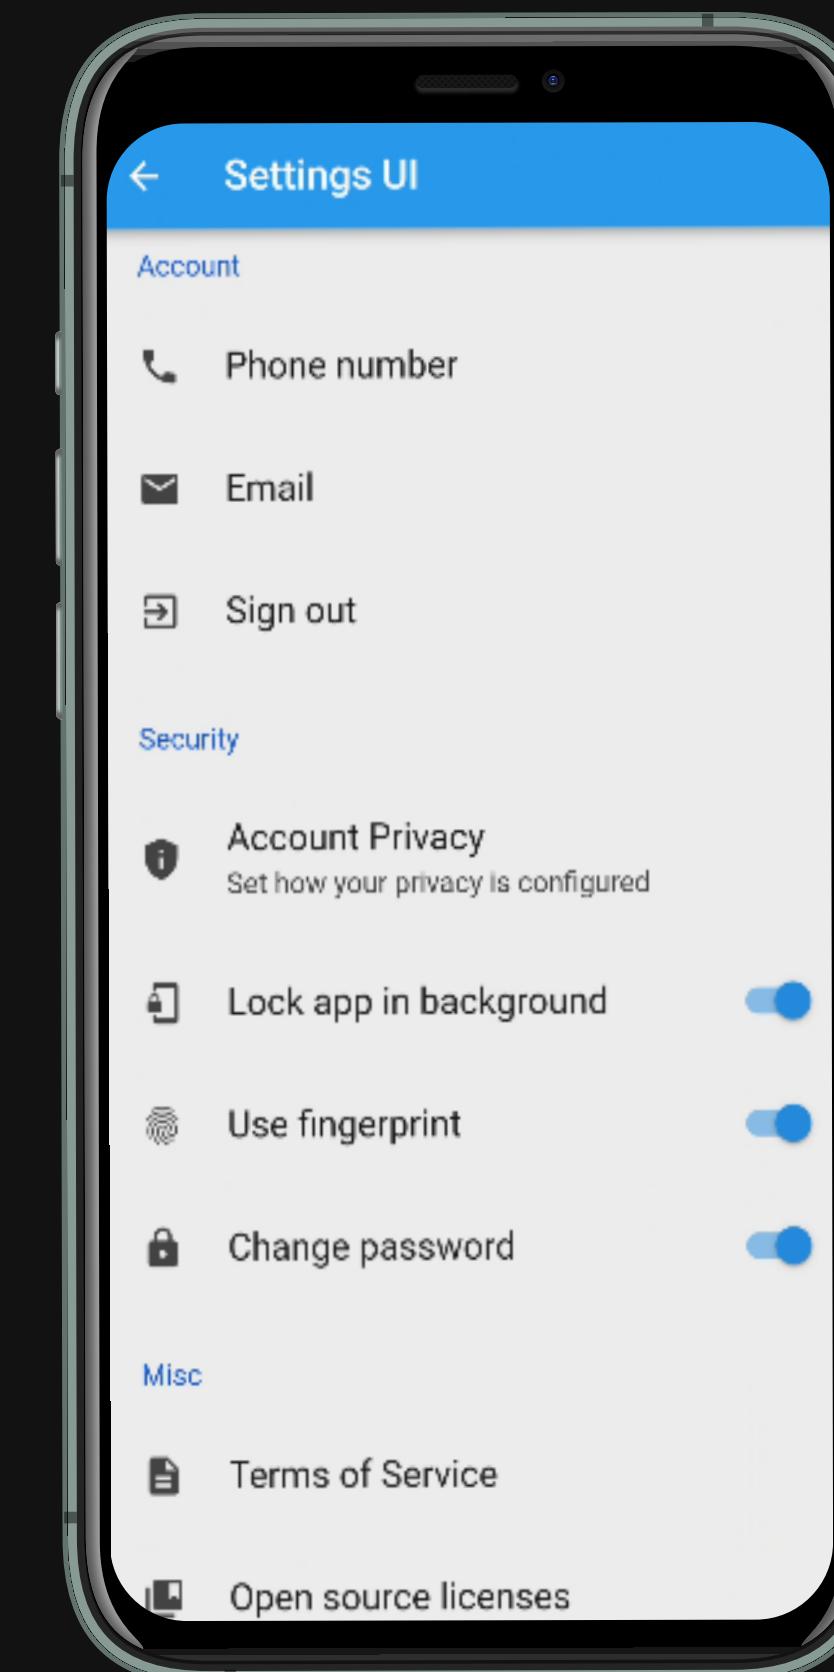

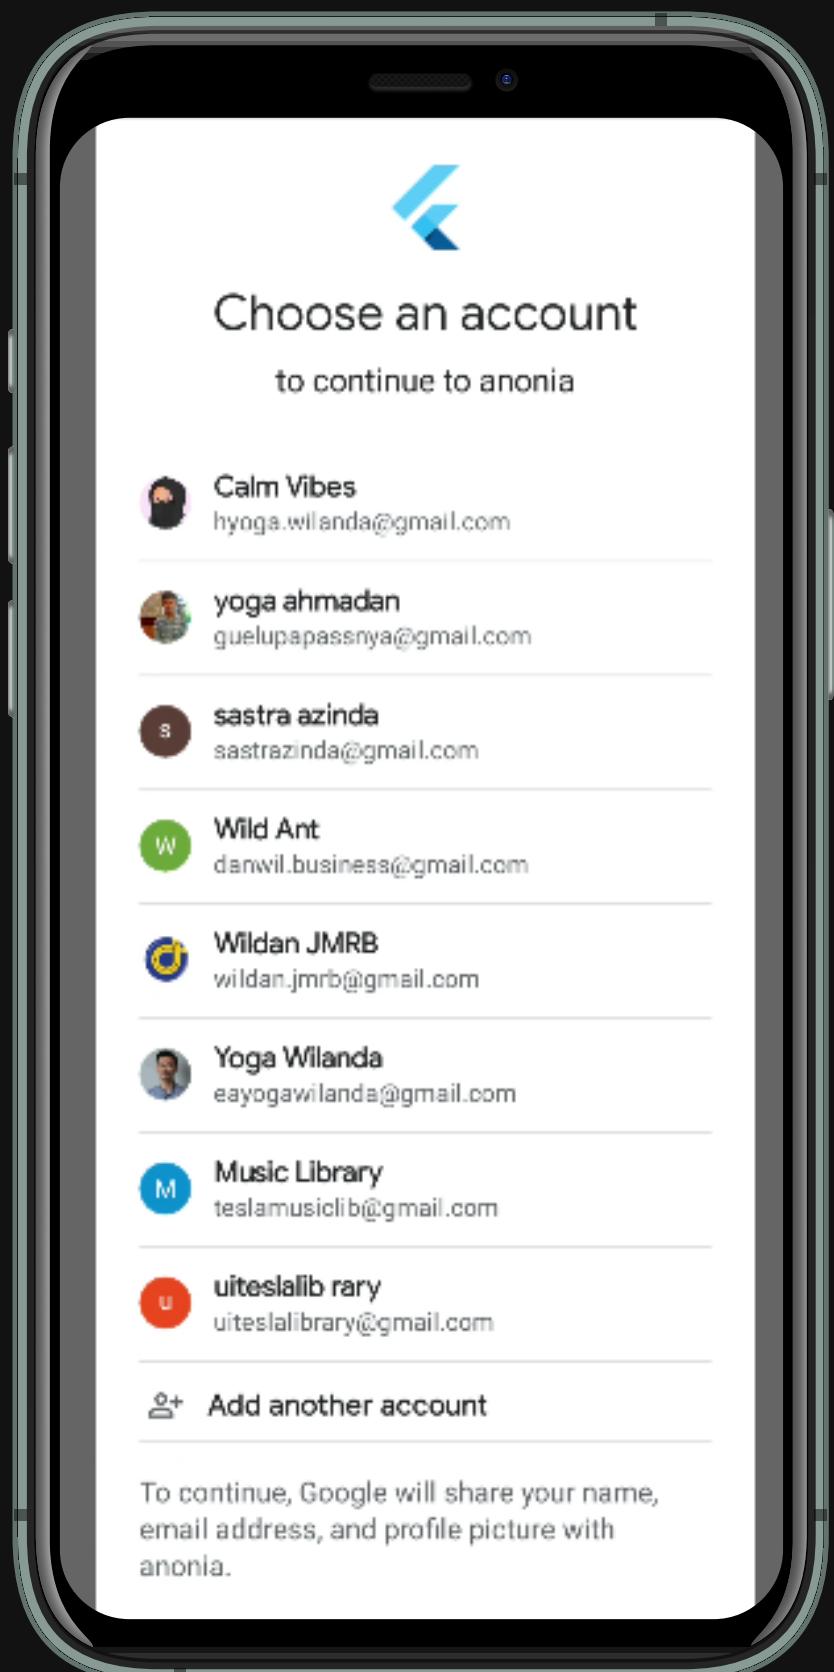

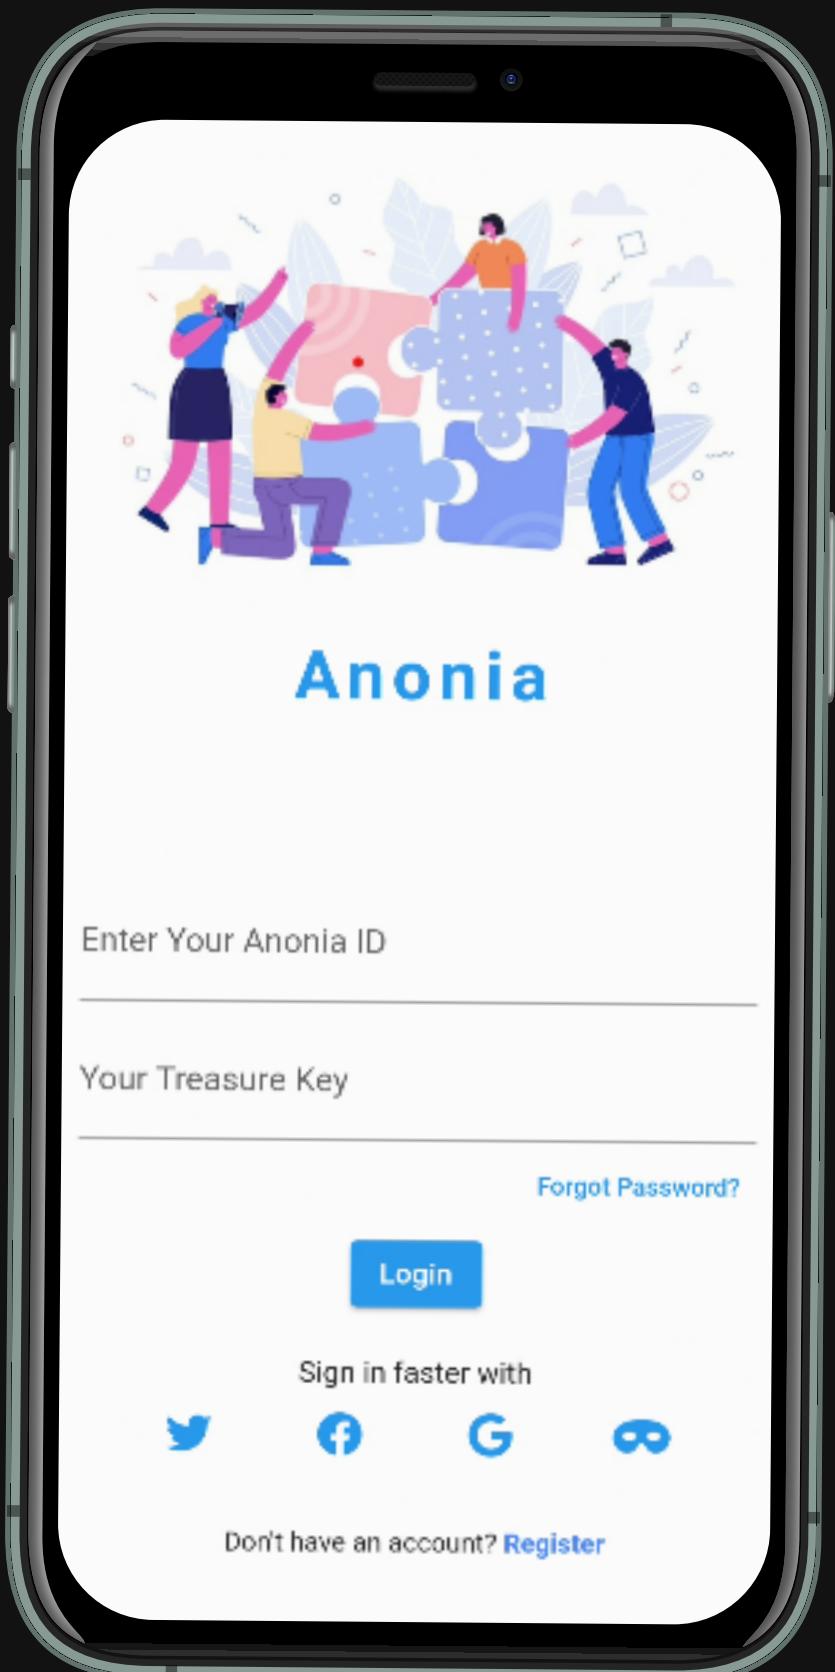

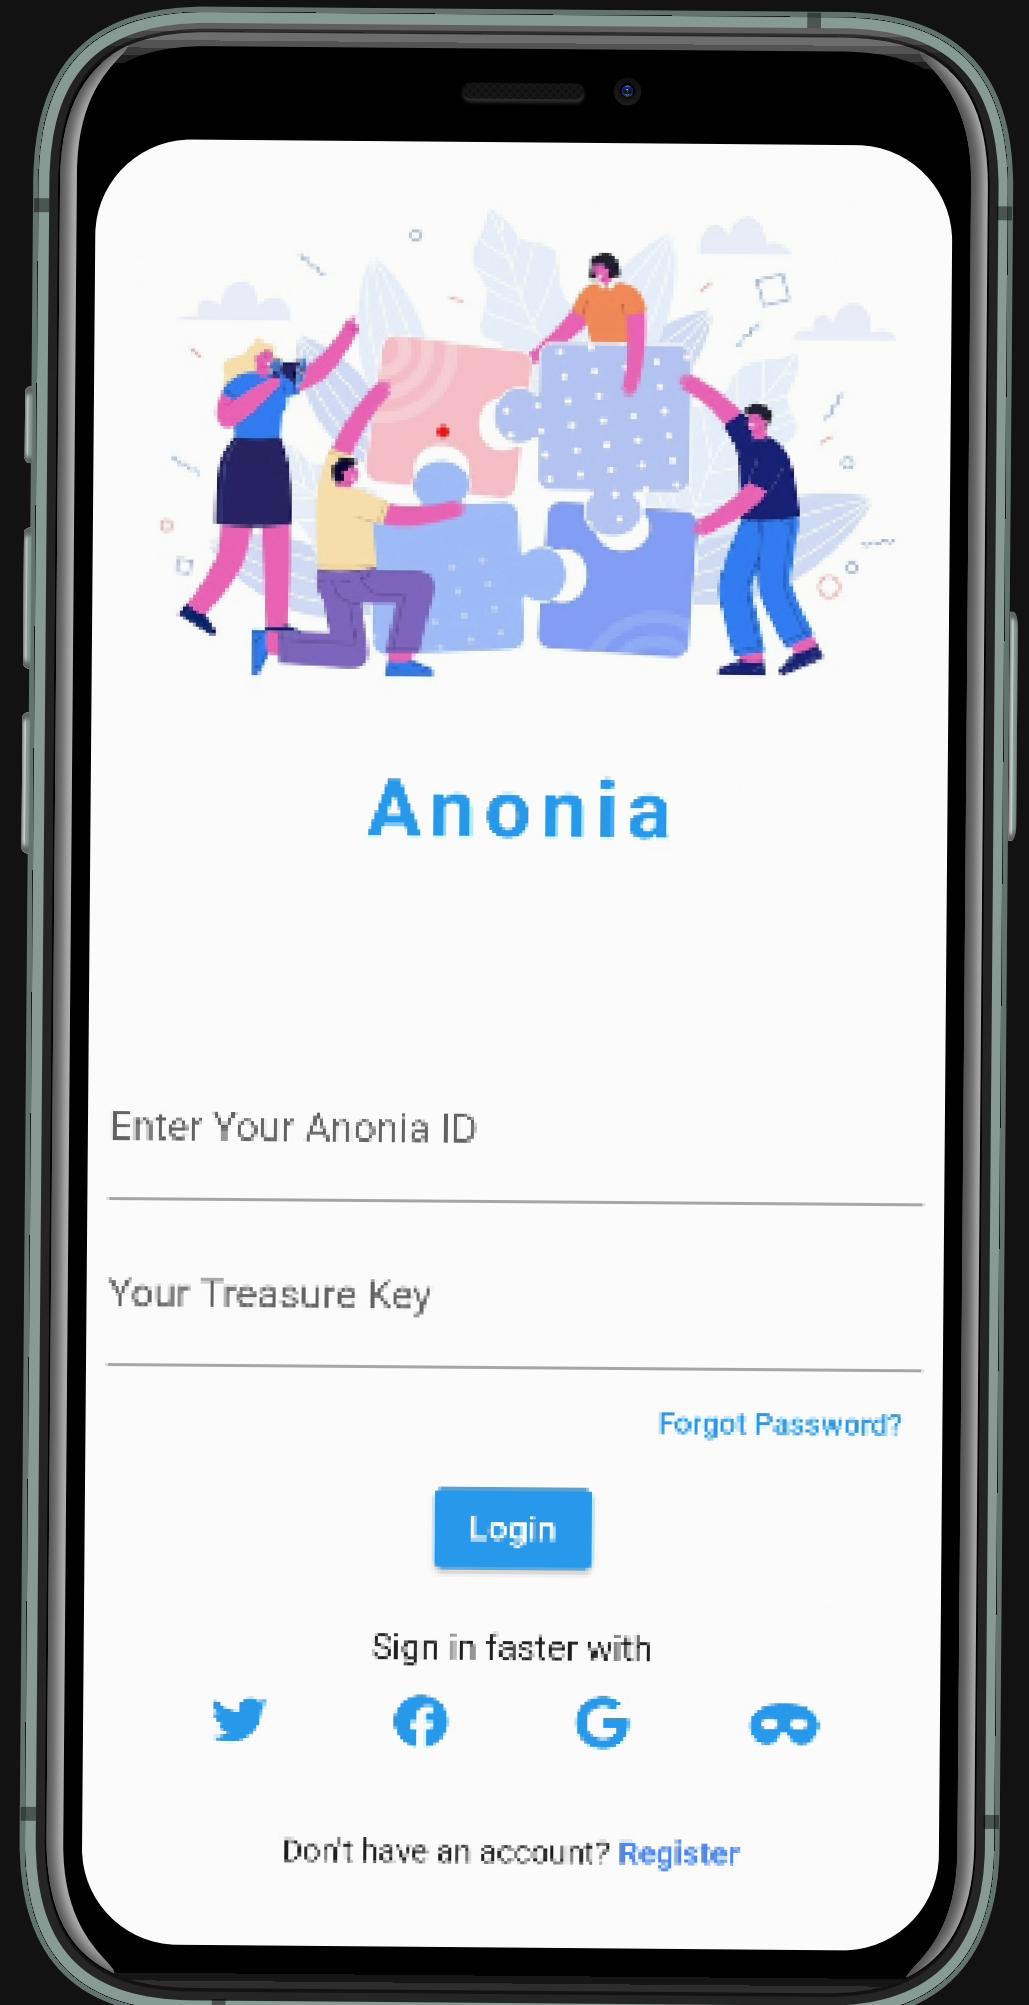

Test the project.

The apps are currently under development and there is a lot of things to discover as well.

But if you want to check how the apps are currently maintained, I put my github repository [here](#).

Overview #1.

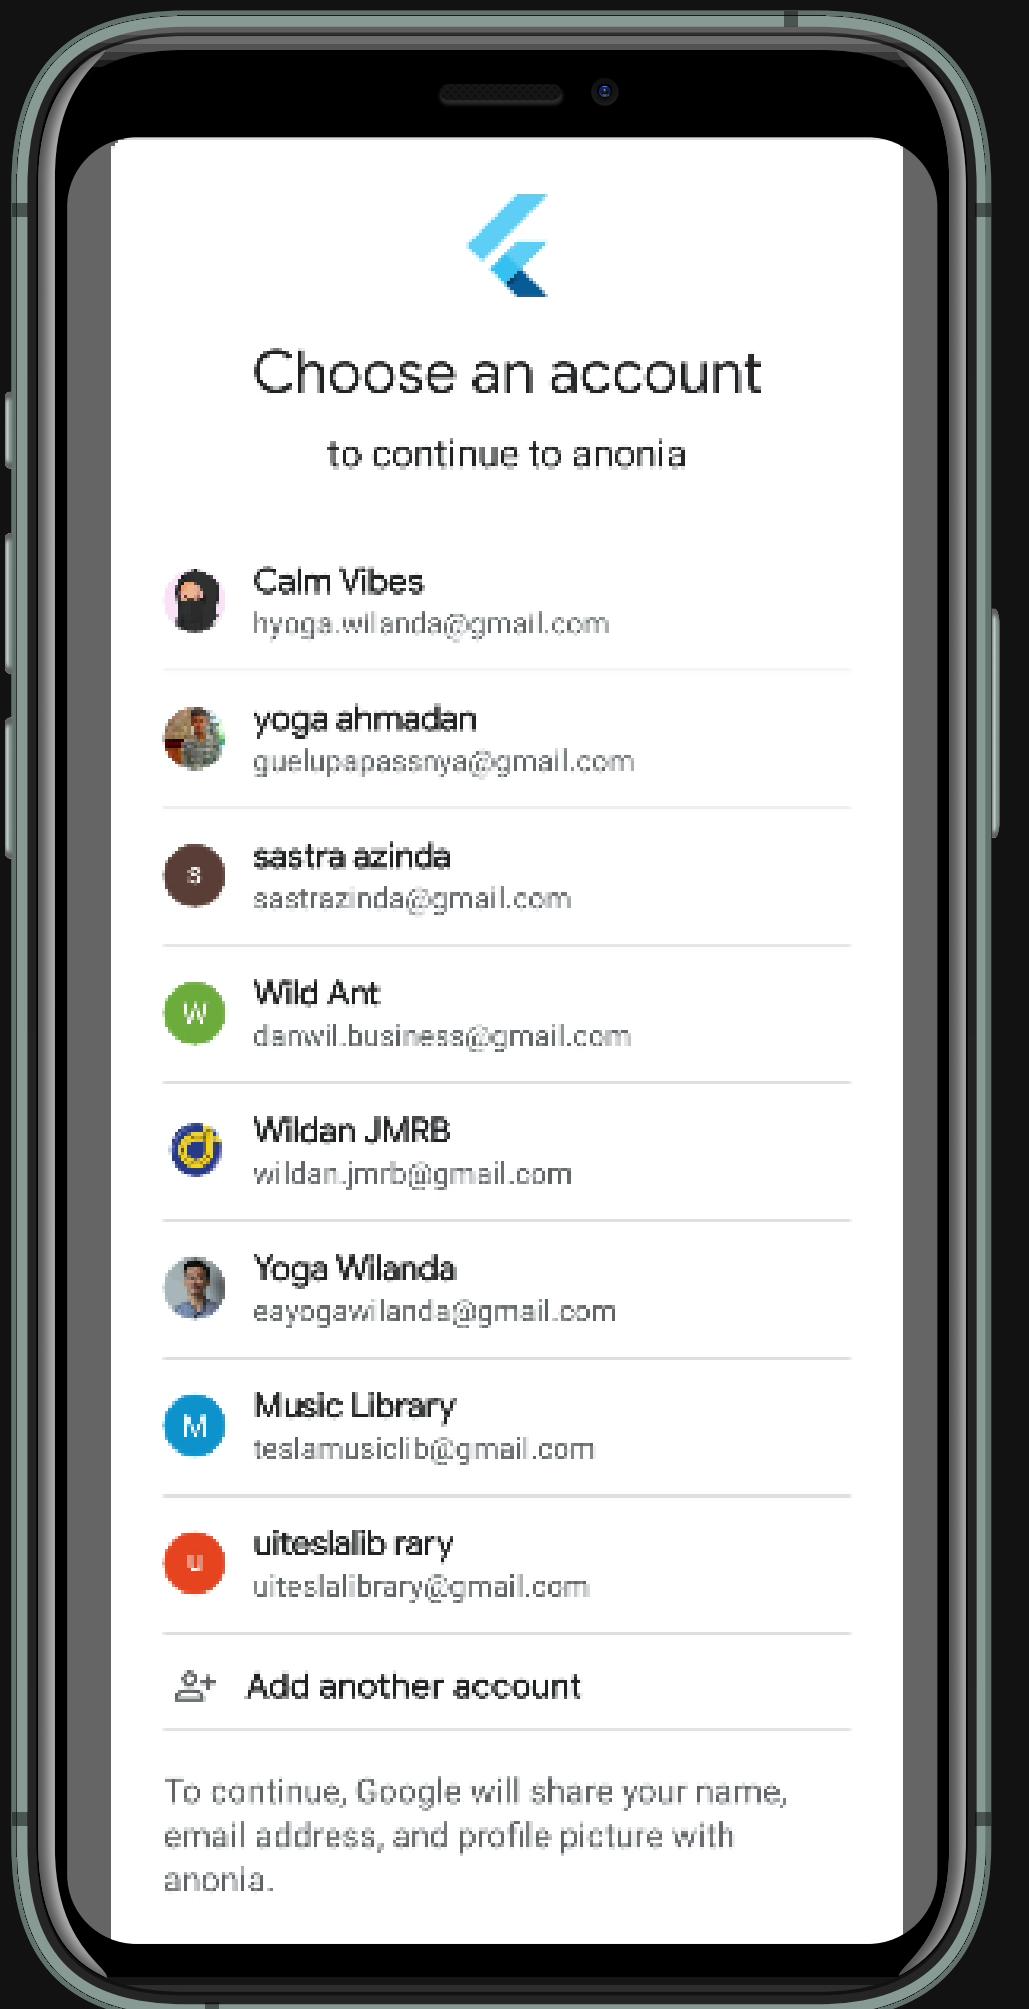

Anonia | Authentications

This Page consist of user authentication which lead user toward the user credentials.

On the otherhand, I plan to develop 3 ways of authentication.

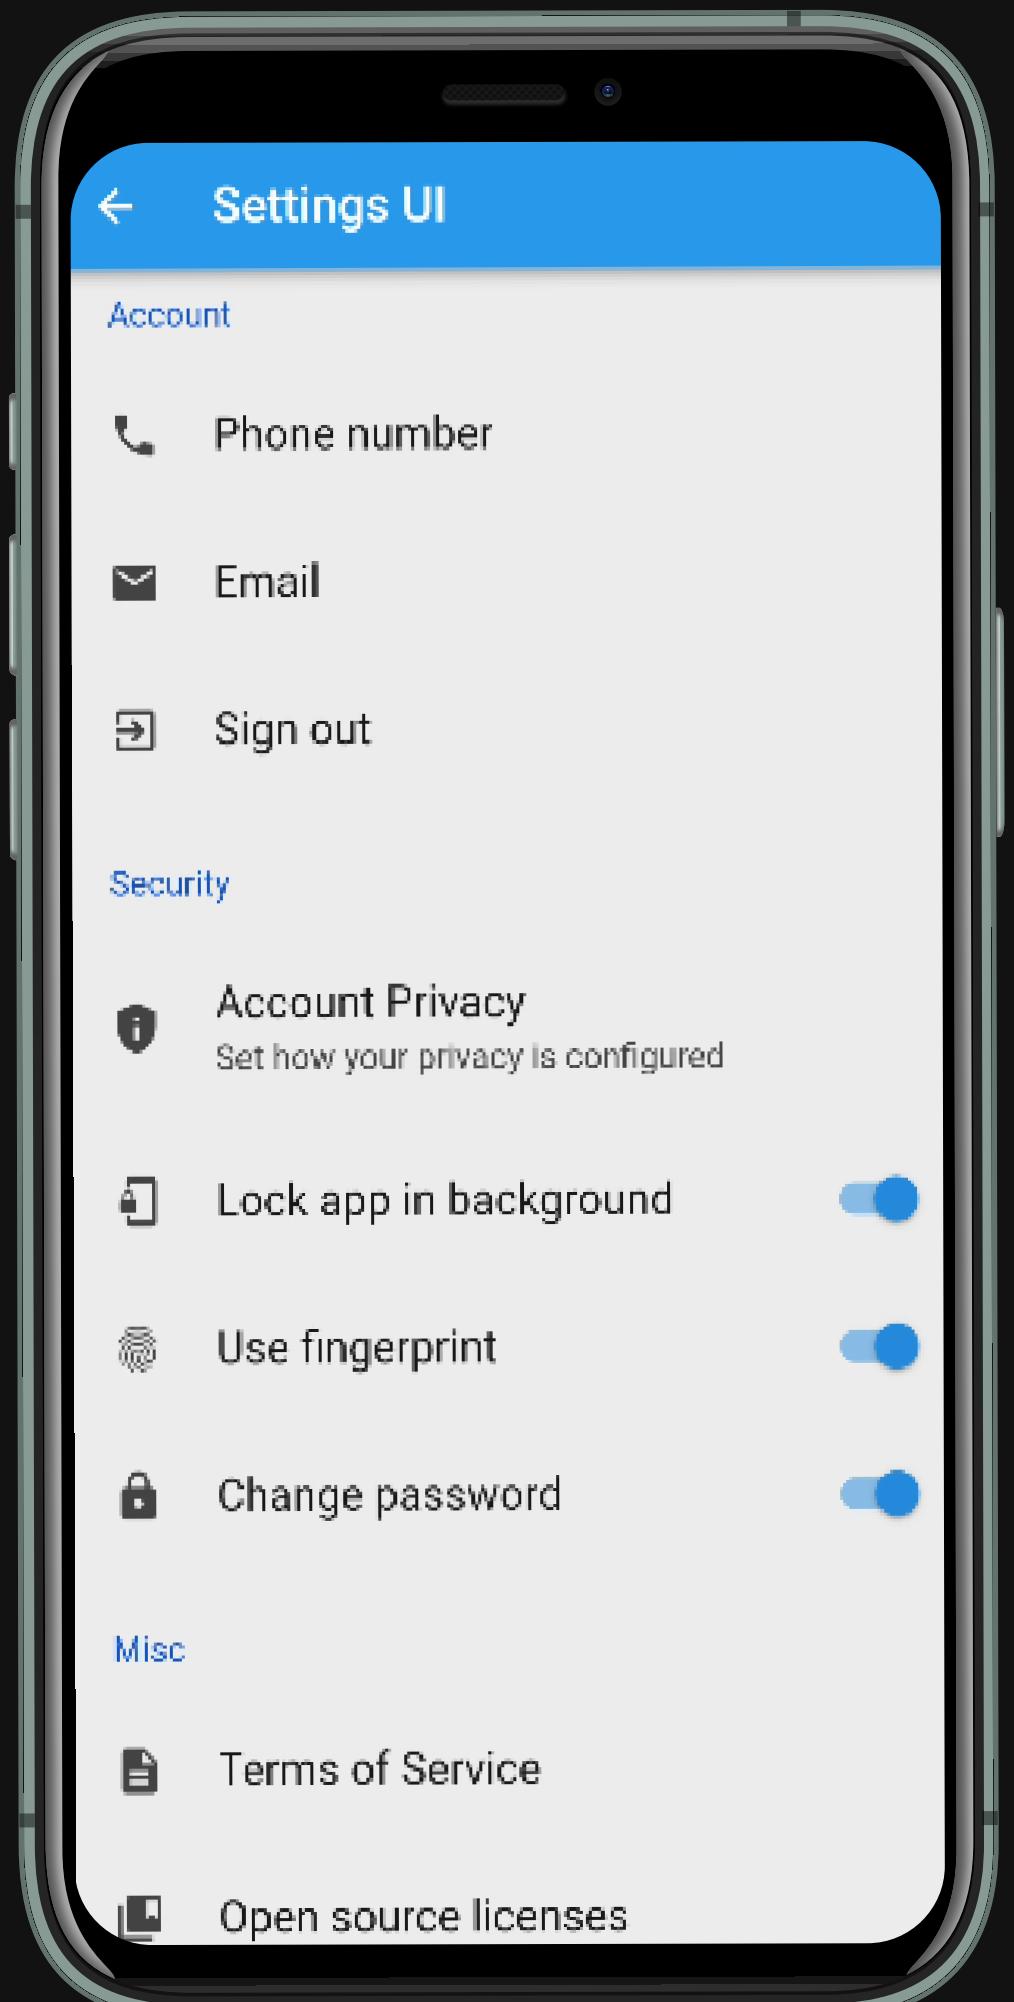

1. Login with email.
2. Login with social media credentials(Google, Facebook, and Twitter).
3. Anonymous Login/Guest mode.

Anonia | Quick Sign-In Feature

This Screenshot show how quick Sign-In feature display when the user click on it.

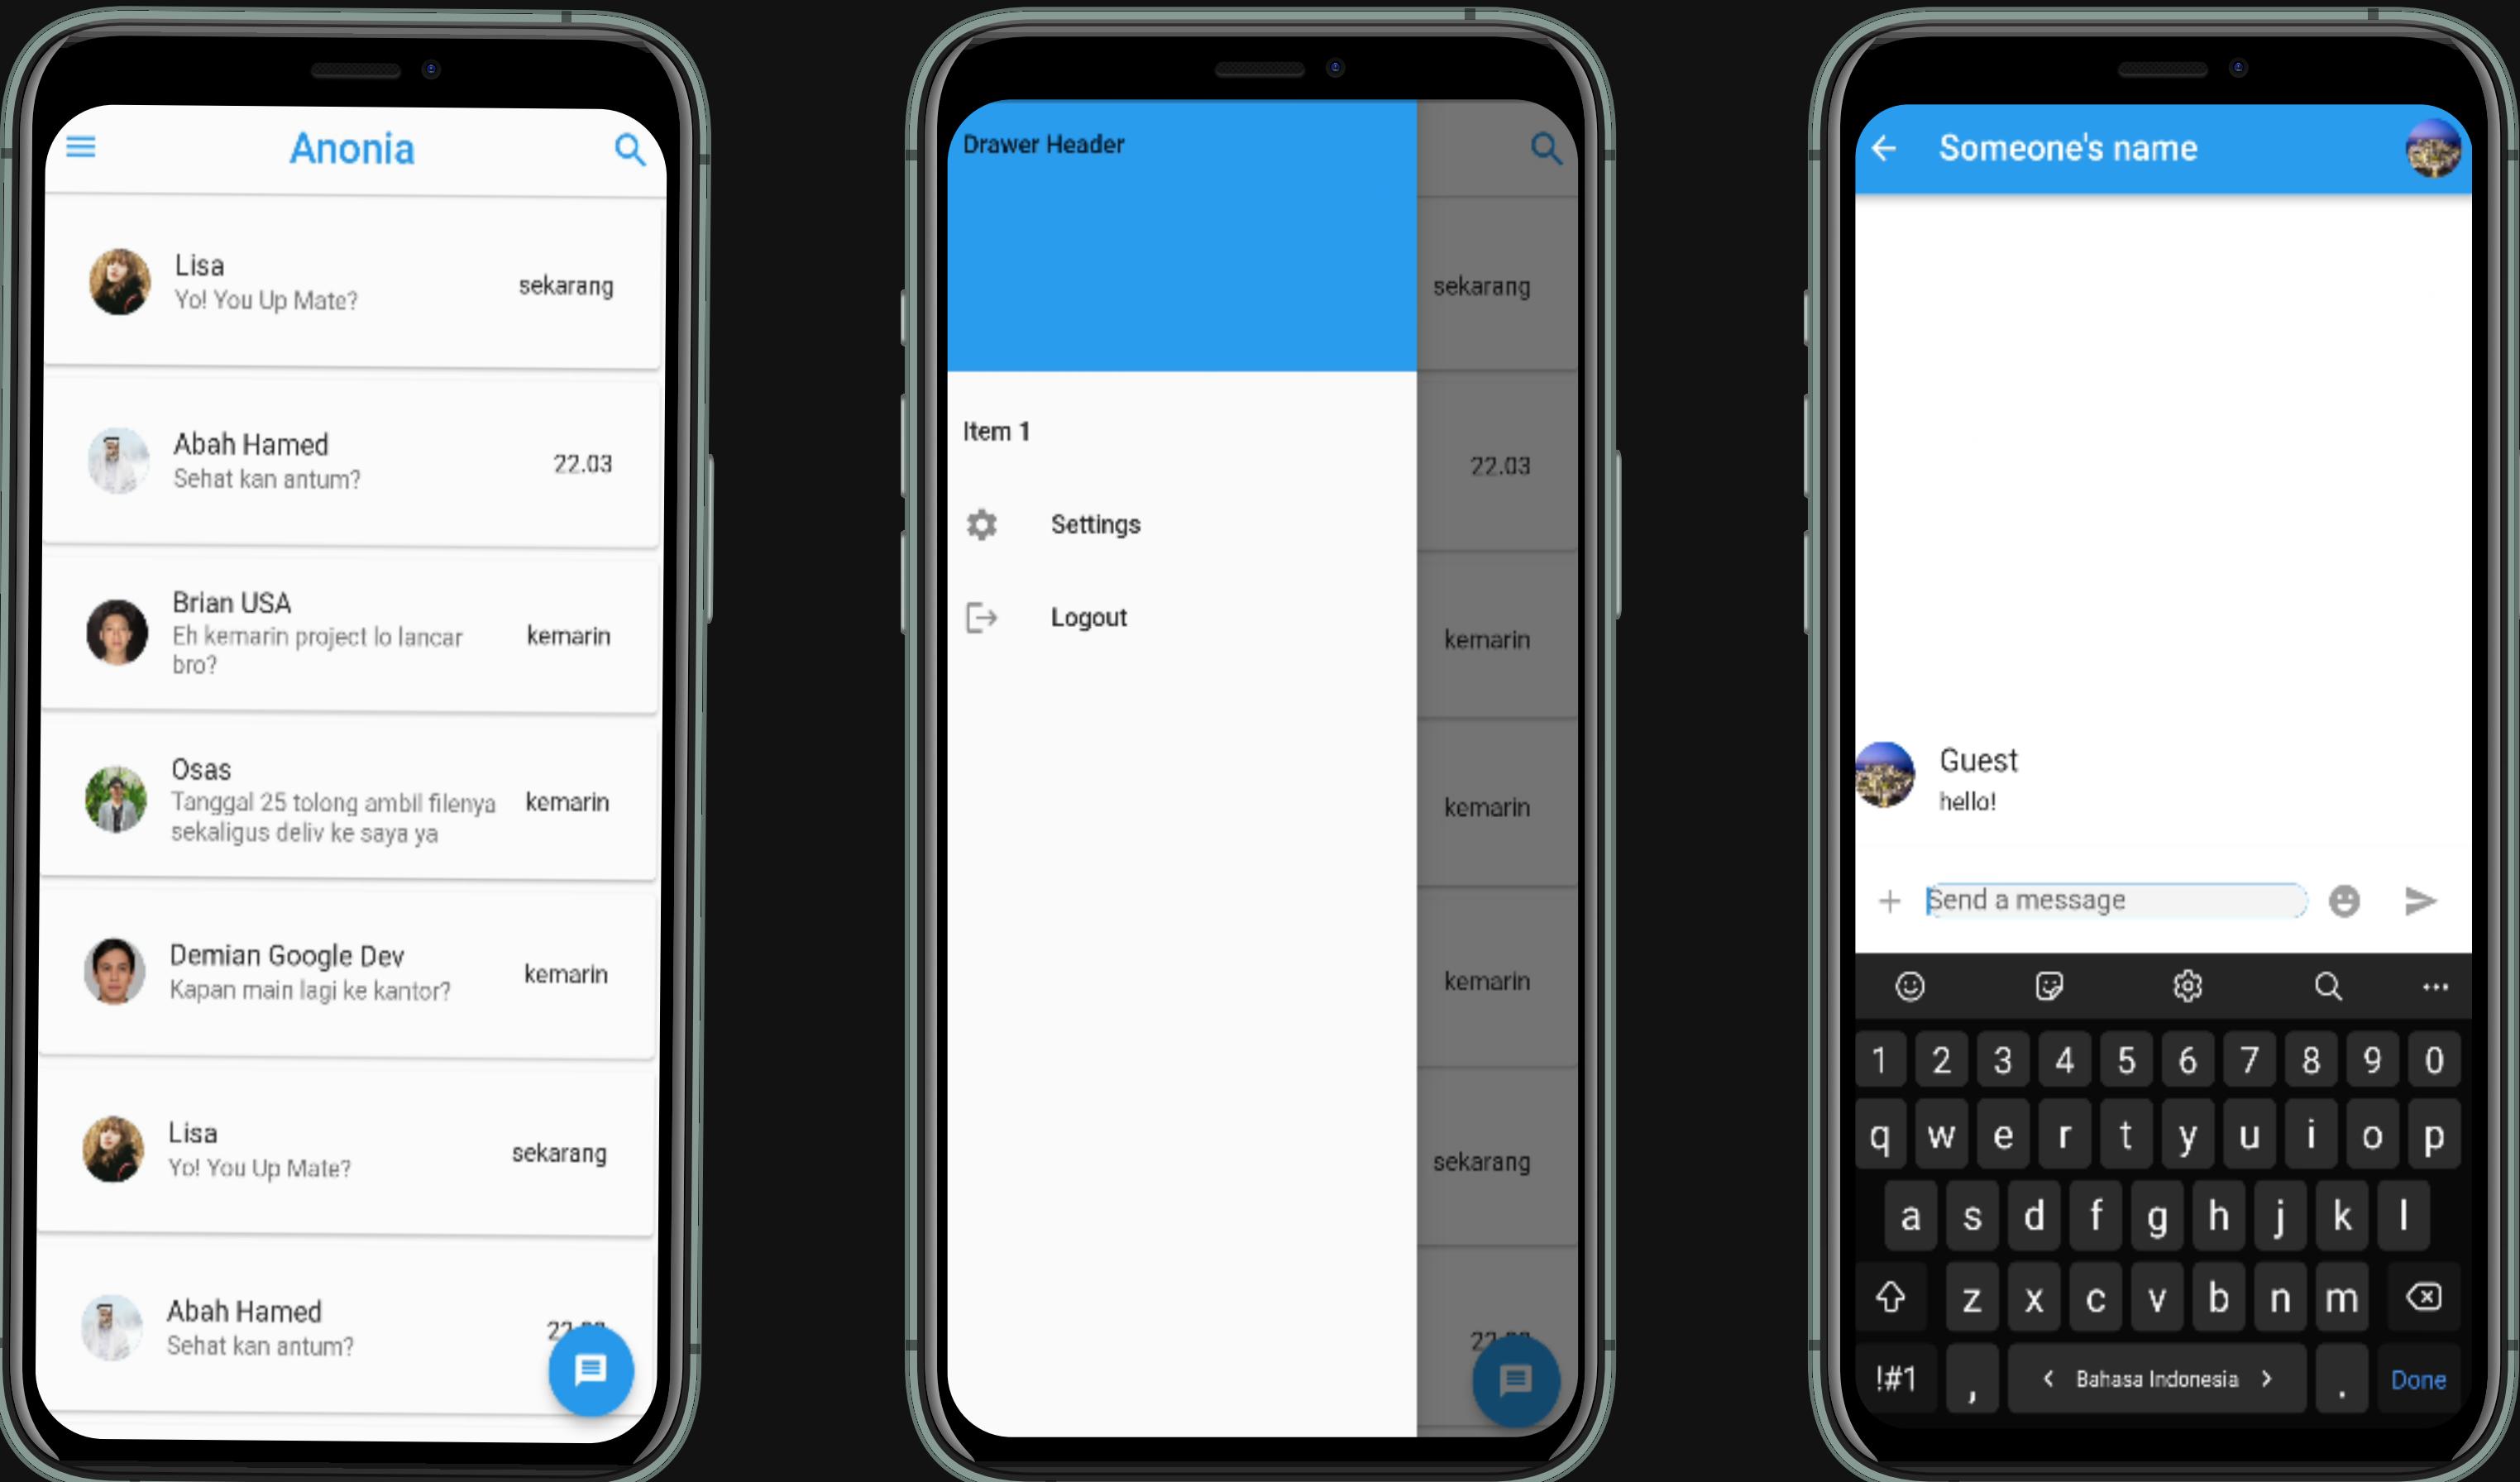

Based on UX i had read, user tend to choose quick sign in rather than using a manual method which input the email addresses and password manually by typing it.

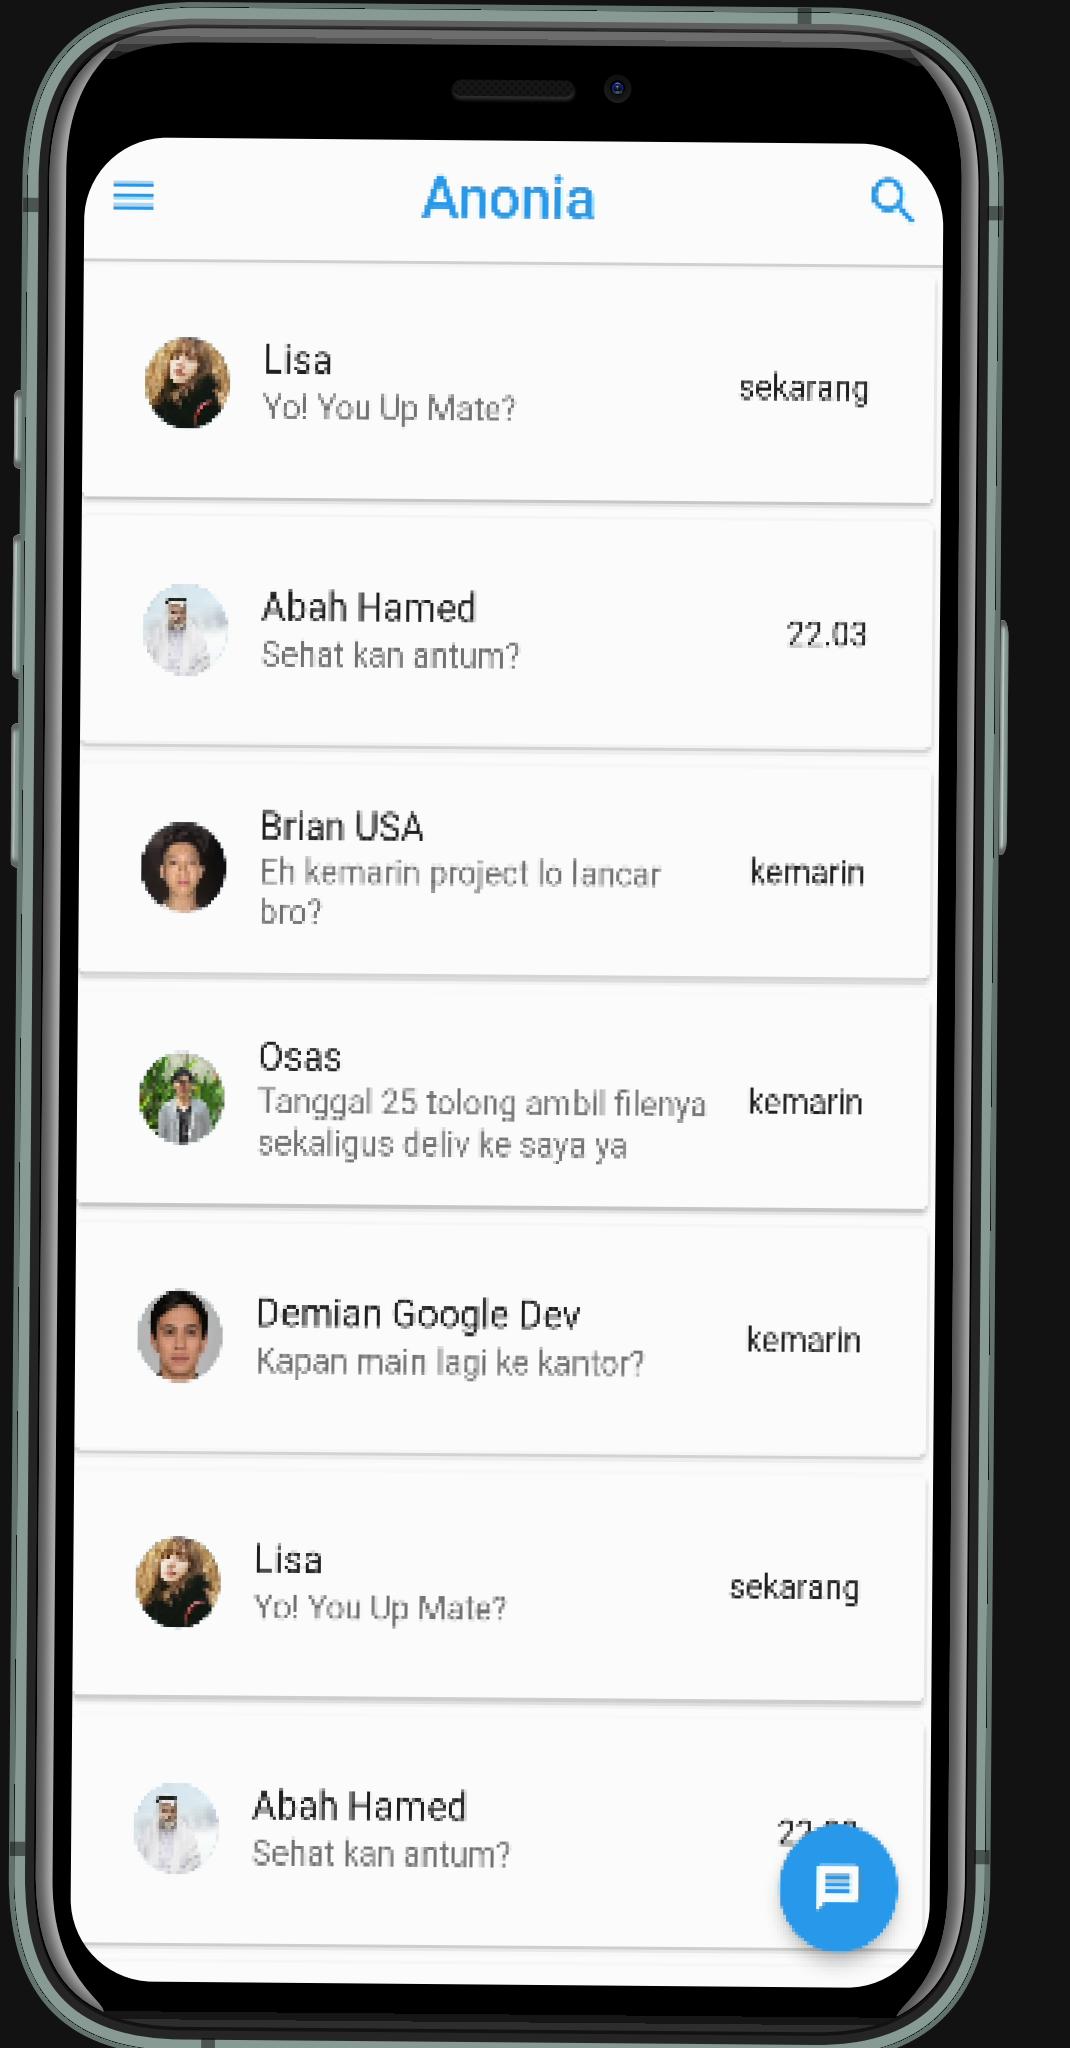

Anonia | Settings

User most likely want to tweak their own interactivity on how they can interact with Anonia apps. Furthermore, This app will allow the user to take simple way to configure it here.

Overview #2.

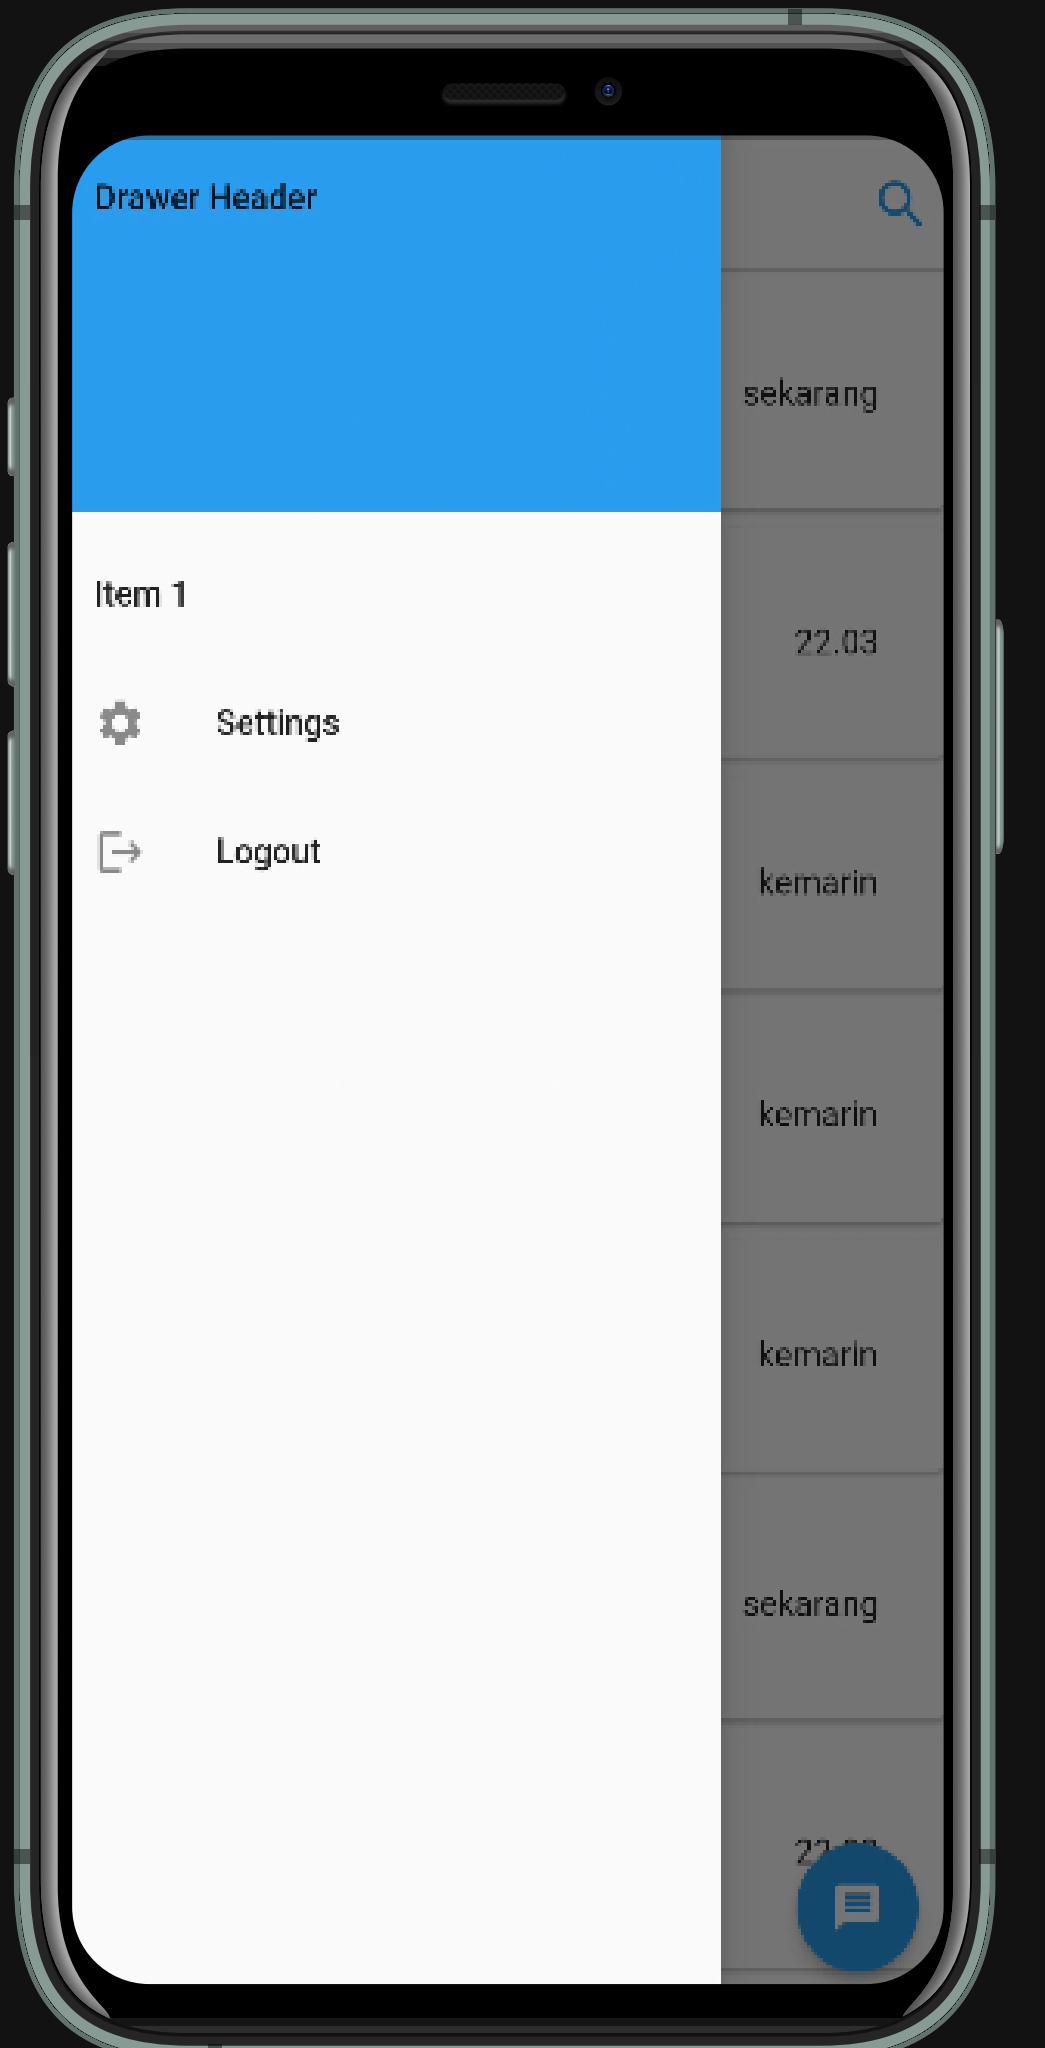

Anonia | Homepage

Just like usual UI for Homepage for messaging application,
It consist of List of conversation between users.

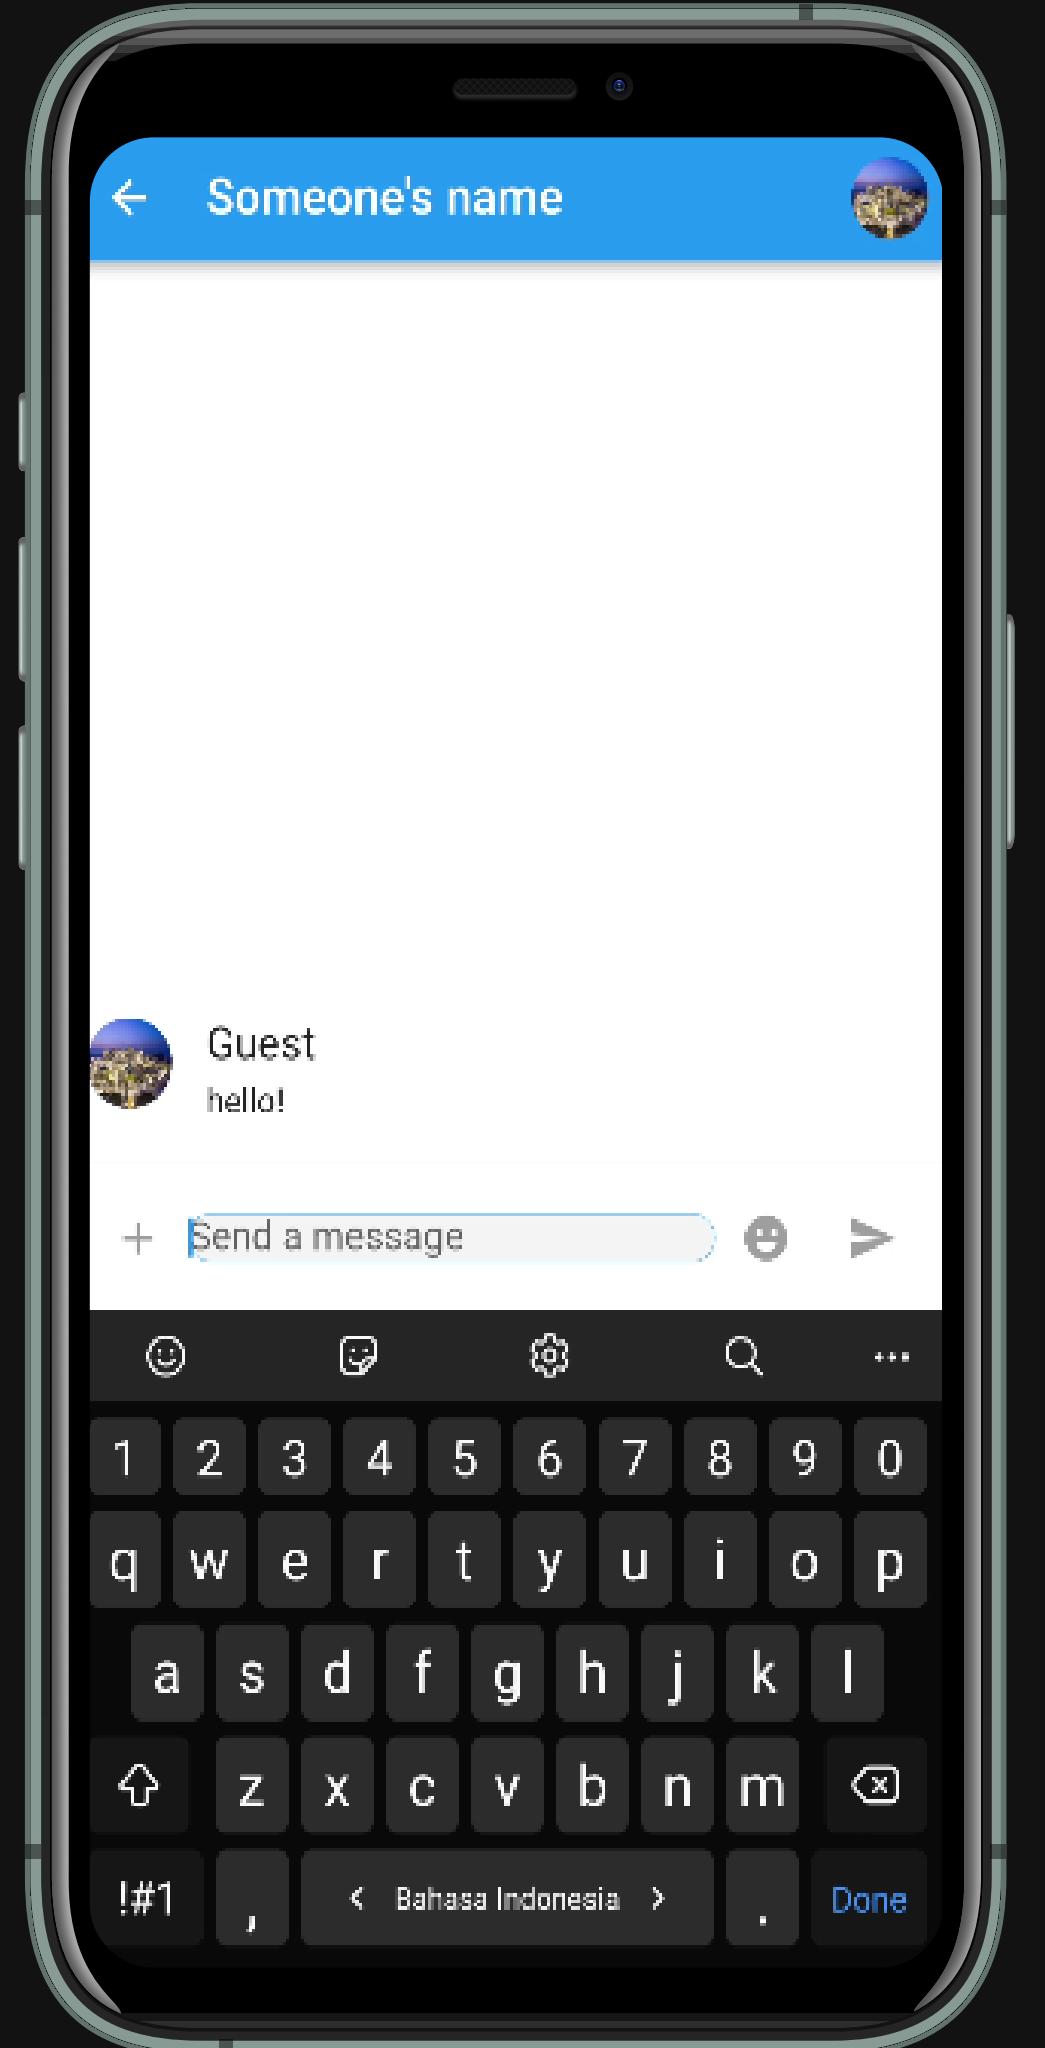

to explain why it should not be as different as other messaging apps, is because I personally want user can be familiar to its interface with a small unique style such as colors, placement of buttons, and how gesture can lead to advanced interactivity as a differentiation against other similar apps.

Anonia | Drawer

Since mobile device have limited space on vertical bases. I personally agree why does every app on mobile uses single “option” button to resolve its limitation.

By this mean, using Drawer Widget is necessary to let the user access their additional option.

Anonia | ChatPage

The main function of this app lay on here.

Basically it was nothing fancy. But I decide to add some animation whenever user sends messages after they tapped the send button.
